

## Appendix 2

### 1) Arithmetic Sequences

Here is an arithmetic sequence: 7, 10, 13, 16, 19, 22, 25, ...

The first term is 7 and the difference between consecutive terms is 3

$$u_1=7 \quad u_2=7+(3)=10 \quad u_3=7+(2 \times 3)=13 \quad u_4=7+(3 \times 3)=16 \quad \dots \quad u_n=7+(n-1)3$$

In general:

Arithmetic sequence:  $a+(a+d)+(a+2d)+(a+3d)+(a+4d)+\dots$

The  $n$ th term is  $u_n=a+(n-1)d$

### 2) Geometric Sequences

Here is a geometric sequence:

$$2, 6, 18, 54, 162, 486, 1458, \dots$$

The first term is 2 and the ratio of consecutive terms is 3

$$u_1=2 \quad u_2=2 \times (3)=6 \quad u_3=2 \times (3^2)=18 \quad u_4=2 \times (3^3)=54 \quad \dots \quad u_n=2(3^{n-1})$$

In general:

Geometric sequence:

$$a, ar, ar^2, ar^3, ar^4, \dots$$

The  $n$ th term is:

$$(ar^{n-1})$$

Summing an infinite geometric series:

$$S=a+ar+ar^2+ar^3+ar^4+\dots$$

So:

$$rS=ar+ar^2+ar^3+ar^4+ar^5+\dots$$

So:

$$S-rS=(a+ar+ar^2+ar^3+ar^4+\dots)-(ar+ar^2+ar^3+ar^4+ar^5+\dots)=a$$

So:

$$S(1-r)=a$$

So:

$$S=\frac{a}{1-r} \quad \text{this result is only valid if } -1 < r < 1$$

### 3) Indices

examples

$$3^2 \times 3^4 = (3 \times 3) \times (3 \times 3 \times 3 \times 3) = 3^6$$

$$\frac{3^6}{3^2} = \frac{3 \times 3 \times 3 \times 3 \times 3 \times 3}{3 \times 3} = 3^4$$

$$\frac{3^6}{3^5} = \frac{3 \times 3 \times 3 \times 3 \times 3 \times 3}{3 \times 3 \times 3 \times 3 \times 3} = 3 \quad \text{but} \quad \frac{3^6}{3^5} = 3^1$$

$$\frac{3^6}{3^6} = \frac{3 \times 3 \times 3 \times 3 \times 3 \times 3}{3 \times 3 \times 3 \times 3 \times 3 \times 3} = 1 \quad \text{but} \quad \frac{3^6}{3^6} = 3^0$$

$$(3^4)^2 = (3 \times 3 \times 3 \times 3) \times (3 \times 3 \times 3 \times 3) = 3^8$$

$$3^{-4} \times 3^4 = 3^0 = 1 \quad \text{so} \quad 3^{-4} = \frac{1}{3^4}$$

$$3^{1/2} \times 3^{1/2} = 3^1 = 3 \quad \text{so} \quad 3^{1/2} = \sqrt{3}$$

$$3^{\frac{5}{2}} = \left(3^{\frac{1}{2}}\right)^5$$

in general

$$(x^m)(x^n) = x^{m+n}$$

$$\frac{x^m}{x^n} = x^{m-n}$$

$$x^1 = x$$

$$x^0 = 1$$

$$(x^m)^n = x^{mn}$$

$$x^{-m} = \frac{1}{x^m}$$

$$x^{1/2} = \sqrt{x}$$

$$x^{\frac{m}{n}} = \left(x^{\frac{1}{n}}\right)^m$$

### 4) Logarithms

If  $125 = 5^3$  then  $\log_5 125 = 3$

In general:

If  $c = a^b$  then  $\log_a c = b$

Now

$$8 = 2^3 \quad \text{so} \quad \log_2 8 = 3 \quad \text{and} \quad 32 = 2^5 \quad \text{so} \quad \log_2 32 = 5$$

examples

$$8 \times 32 = 2^{3+5} \quad \text{so} \quad \log_2 (8 \times 32) = \log_2 8 + \log_2 32$$

in general

$$\log_a (xy) = \log_a (x) + \log_a (y)$$

$$\frac{32}{8}=2^{5-3} \quad \text{so} \quad \log_2\left(\frac{32}{8}\right)=\log_2 32-\log_2 8$$

$$\log_a\left(\frac{x}{y}\right)=\log_a(x)-\log_a(y)$$

$$32^4=(2^5)^4=2^{4 \times 5} \quad \text{so} \quad \log_2(32^4)=4\log_2 32$$

$$\log_a(x^n)=n\log_a(x)$$

## 5) Factor theorem

example

$$f(x)=x^2-5x+6$$

So:

$$f(2)=2^2-(5 \times 2)+6=0$$

The factor theorem tells us that if  $f(2)=0$  then  $(x-2)$  is a factor of  $f(x)$

So:

$$f(x)=(x-2)(\dots)$$

In general:

If  $f(a)=0$  then  $(x-a)$  is a factor of  $f(x)$

## 6) Factorials

$$1!=1$$

$$2!=1 \times 2$$

$$3!=1 \times 2 \times 3$$

$$4!=1 \times 2 \times 3 \times 4 \quad \text{etc}$$

## 7) Binomial theorem for multiplying out brackets

$$(1+x)^1=1+x$$

$$(1+x)^2=1+2x+x^2$$

$$(1+x)^3=1+3x+3x^2+x^3$$

$$(1+x)^4=1+4x+6x^2+4x^3+x^4$$

In general: if  $n$  is a positive integer

$$(1+x)^n=(nC0)+(nC1)x+(nC2)x^2+(nC3)x^3+\dots+(nCn)x^n$$
